TOPIC TAGS: pressure measurement, pressure gage, pressure transducer

ABSTRACT: A series of instruments, including a capacitive pressure gage, are proposed for controlling the pressure of fused plastic materials. Their sensitive element is in the form of a membrane (a capacitor plate) which, under the effect of a perceptible pressure, is displaced, thus changing the capacitance. A circuit diagram of a capacitive pressure gage is presented. Wire resistance gages are also proposed for use in the pressure control in fused materials. The principle of their operation is based on changes in their electric resistance caused either by stress or strain. A special manometer is also proposed in which the pressure is determined by changes in the electric resistance of a transducer attached to the sensitive element of the manometer. The design of a pressure gage with attachable wire resistors is described. [Translation of abstract] 5 illustrations and bibliography of 4 titles. E. Vtyurina

New method of producing bimetal plate for high pressure vessels (Novyy sposob proizvodstva tolstolistovogo dvukhsloynogo prokata dlya sosudov vysokogo davleniya) Kiev, Naukova dumka, 65. 0059 p. illus., biblio. (At head of title: Akademiya nauk Ukrainskoy SSR. Ordena trudovogo krasnogo znameni institut elektrosvarki im. YE O. Patona) 1,000 copies printed.

TOPIC TAGS: bimetal, steel, electroslog welding, pressure vessel, fabricated structural metal

PURPOSE AND COVERAGE: The brochure describes a new method of producing a bimetal plate by electroslog welding. Several ways of producing such a plate are mentioned and several metal processing problems in welding large size mixed steels are covered. Also, the brochure discusses the production of thick section welded high pressure vessels from bimetal steels. This book is recommended for scientists and technical engineers in electric welding and designing of high pressure vessels as well as for students and aspirants in the universities of corresponding specialties.

Title : The Adsorption of Sudan Red in a Medium of Vegetable
and Mineral Oils.

Orig Pub : Chem. zvesti, 1957, 11, No 5, 267-273.

Abstract : Results were studied of the influence of the conditions
of application, and of repeated utilization on the ad-
sorption properties of clay of the montmorillonite type,
which is used for bleaching vegetable fats and oils;
as well as the possibilities of utilizing organic dyes
for the evaluation of the activity of fresh and used
clays in various conditions. It was established that
the adsorption properties are decreased during processing
of both unpurified and refined vegetable oils, depending

on the temperature during which processing was carried out. At high temperatures of adsorption, inactivation of the clay with products of pyrolytic decomposition occurs. It was shown that refined oils and distilled methyl ethers of high fatty acids obstruct the active centers of clay which adsorb sudan red.

AUTHOR: Jares, Vladimir (Engineer); Novotny, Beno

TITLE: A 190-millimeter x-ray image intensifier. Problems of the electronic-optical system

SOURCE: Slaboproudny obzor, v. 25, no. 1, 1964, 11-17

TOPIC TAGS: x-ray, image intensifier, electrode system, photocathode

ABSTRACT: The determination of the electronic-optical properties of the immersion lense of the x-ray image intensifier depending on some changes in the geometry of the electrode system is a complicated problem, the complete theoretical solution of which is still unknown. Experimental measurements using complete experimental models yield the necessary values but are time consuming and expensive. The authors present a theoretical electrode system with a spherical field. The principle of the x-ray image intensifier shown in Fig. 1 of Enclosure 01 is described, and relations for magnification and picture plane distance are stated. An experimental assembly shown in Fig. 7 of Enclosure 02 was designed; its input part (primary luminescent screen and

Card 1/52

ACCESSION NR: AP4015896

photocathode) was replaced by a concave aluminum disk shown in Fig. 3 of Enclosure 03 for determining the imaging properties of transducer electrode systems. Graphs are presented to show the results of measurements which served as a basis for designing an x-ray image intensifier with a 190-mm photocathode. According to the authors, the method may be applied in most cases when the electrostatic field under investigation is expected to transmit electrons emitted from the photocathode surface either to the screen as an image or to the anode as current. Orig. art. has 17 formulas and 15 figures.

"Instruments for Measurement of Aerosol Concentrations Used in the Control of Hygiene in Prague."

Prague, Pracovni Lekarstvi, Vol 18, No 10, Dec 66, pp 1442-1444

Abstract [Authors' English summary modified]: An instrument designed by the authors is described; it is based on particle filtration by a membrane filter. Light transparency of the filter is recorded. The accumulation of the particles on the membrane influences the amount of light passing through it. The accumulation is proportional to the amount of particles contained in the atmosphere. Evaluation of the results is made by a gravimetric analysis. The recorded curve is used for the determination of the relative amounts of aerosols in the air during the investigated period of time. The instrument has an accuracy of + 5%. 3 Figures, no references. (Manuscript received 6 Nov 65).

Electron-microscopic investigation of some silicon-organic compounds. A. P. Kreshkov and A. M. Vladimirov (D. I. Mendeleev Chem.-Technol. Inst., Moscow). *Doklady Akad. Nauk S.S.S.R.* 63, 185-6(1949).—Powd. ceramic masses made of polymers of methyl and ethyl esters of $\text{Si}(\text{OH})_4$, with various oxide and hydroxide fillers, showed filers gathered into bundles, intertwined to form networks. The filler appears in the form of cryst. or amorphous inclusions. Thin films of these materials showed a similar bundle and network structure.
